Dear Client,

Although Cadmium has excellent corrosion resistance in marine and high chloride areas as well as a very low contact potential with aluminium, it is not ROHS compliant and has health hazards linked to it.

Cadmium is a restricted substance worldwide and is only used when an alternative cannot be found with the same properties as mentioned above. It can be ingested, its fumes inhaled and can be absorbed through the skin.

Health Hazards pertaining to the handling of Cadmium metal include, but not limited to:

1. Carcinogenic and difficult to remove from body.
2. The production of a toxic fume at its melting point of 320°C and should therefore not be used on items that may be subjected to temperatures in excess of 250°C – Welding, fire, etc.

Electroplaters should only be seen as applicators who carry out instructions from your company. We therefore accept no responsibility nor any liability for any damages, problems, etc that may arise from items that have been Cadmium plated by us.

Would you kindly return to us a signed copy hereof for our records.

Yours Faithfully,

G.M JOSEPH
